PROFESSIONAL SUMMARY

Junior Flutter Developer building cross-platform mobile applications with Dart, BLoC state management and feature-first Clean Architecture. Strongest project is a two-sided ride-hailing app covering both rider and driver flows: live map tracking, driver dispatch, server-priced fares, an in-app wallet and push notifications, with 1,293 automated tests and a PostgreSQL backend that owns the ride lifecycle. Comfortable across the mobile stack, from Flutter UI and REST API integration through Supabase, PostgreSQL, Google Maps and native Android work in Kotlin. Software Engineering student at Arab International University, freelancing since 2025.

TECHNICAL SKILLS

Mobile Development: Flutter, Android, Cross-Platform Development, Material 3, Responsive UI, Localization (Arabic and English, RTL)
Programming Languages: Dart, SQL, Kotlin (native Android integration), JavaScript. Web: React.js, Tailwind CSS
State Management and Architecture: BLoC, Cubit, Provider, Clean Architecture, Feature-First Architecture, Repository Pattern, Use Cases, Dependency Injection (get_it), SOLID Principles
Backend and Databases: Supabase (Authentication, Realtime, Storage, Edge Functions), PostgreSQL, PostGIS, Row Level Security, SQL Functions and Triggers
APIs and Integrations: REST API Integration, HTTP, Dio, JSON Parsing, Google Maps SDK, Google Routes API, Firebase Cloud Messaging
Testing and Tools: Unit Testing, Widget Testing, flutter_test, Static Analysis, Git, GitHub, Android Studio, go_router, flutter_screenutil

PROJECTS

Mashwarak - Arabic-First Ride-Hailing Platform (Personal Project)

Rider and driver apps in one Flutter build: 14 features, 1,293 automated tests, Arabic-first with full RTL support. Technologies: Flutter, Dart, BLoC, Supabase, PostgreSQL, PostGIS, Kotlin, Google Routes API, Firebase Cloud Messaging

- Fixed a concurrency bug where a driver could be told they had lost a ride they had actually won. Revoked client write access to the trips table and rebuilt every state transition as a row-locking SECURITY DEFINER function in PostgreSQL returning a typed result code, so the database decides the outcome instead of the app inferring it.
- Built the security model at the database layer: 63 Row Level Security policies, 103 PostgreSQL functions and 24 migrations. Trigger guards stop a client editing its own verification status or wallet balance, uploaded ID documents are checked for ownership, and completed fares are locked so later pricing changes cannot rewrite past rides.
- Structured rider and driver as one Flutter binary across 14 features on feature-first Clean Architecture, using flutter_bloc, repository interfaces, use cases and get_it dependency injection.
- Integrated live trip tracking over Supabase Realtime, PostGIS proximity matching for driver dispatch, Google Routes API v2, phone and OTP sign-in, and Firebase Cloud Messaging push through a Deno Edge Function. Added a native Android foreground service in Kotlin over a MethodChannel.
- Wrote 1,293 passing unit and widget tests across 66 files, including a responsive regression matrix over device sizes and pixel ratios, with zero Flutter analyzer issues.

DamasCoffee - Coffee Ordering Application (Personal Project)

Technologies: Flutter, Dart, BLoC, flutter_bloc

- Migrated the Home feature off setState onto flutter_bloc, splitting it into data, domain and presentation layers with use cases and a repository interface. Auth, cart, checkout and profile still run on StatefulWidget; the migration was scoped to one feature on purpose.
- Replaced a single global spinner with per-section skeleton placeholders driven by a RequestStatus enum.

Repository: github.com/SaadSinan-dev/DamasCoffee | Live Demo: damascocoffee.netlify.app

My Doctor - Doctor Discovery Application (Personal Project)

Technologies: Flutter, Dart, flutter_screenutil. User interface build; authentication and booking are scaffolded, not functional.

- Built a shimmer and skeleton loading system from scratch with AnimationController and ShaderMask, plus responsive doctor discovery (specialty filters, favorites grid, top-doctors list) and defensive route-argument handling in a centralized router.

Repository: github.com/SaadSinan-dev/MyDoctor | Live Demo: mydoctor-sy.netlify.app

Syrian Cart - E-Commerce Application (Personal Project)

Technologies: Flutter, Dart. User interface build using no third-party packages.

- Built the splash sequence, animated bottom navigation, page transitions and a typed custom router using only Flutter's AnimationController and TweenSequence APIs, with no animation, routing or state-management packages.

Repository: github.com/SaadSinan-dev/SyrianCart | Live Demo: syrian-cart.netlify.app

PROFESSIONAL EXPERIENCE

Freelance Flutter Developer | Jan 2026 - Present | Damascus, Syria | Remote

- Build Flutter applications for freelance clients from architecture setup through UI implementation, choosing BLoC, Cubit or Provider to match the size of the project.
- Integrate REST APIs with Dio and HTTP, parse JSON responses, and maintain a reusable set of responsive UI components across projects.

Freelance Frontend Web Developer | Jan 2025 - Present | Damascus, Syria | Remote

- Build responsive, component-based web interfaces with React.js, JavaScript and Tailwind CSS for freelance clients.

EDUCATION

Bachelor of Science in Software Engineering | Arab International University (AIU), Damascus, Syria | 2024 - Present

LANGUAGES

Arabic: Native | English: Intermediate (reading and writing)
